

# Login

Username :

Password :

Session is for the server side. The cookie is for the client side. We want that the cookie expire for the time of 3-4 days. This is for the browser specific , we will use the cookies. logout , the session variables are destroyed.

we will design the front end and make the schema of the database.

no account then sign up, if account then login. We can make the CRUD . there is the popup window: alert, prompt , confirm in the Java Script.

There is the image , audio and video upload in the php. There is some object orientation.

**We will make the designs and then implement the backend logic.**

## User module

For the front-end , the backend will manage the frontend all the page of the html is the static side. The modules are managed by the backend. [User Management](#)

## Role of javascript

1.darkmode and lightmode

2.make the slider

3.do the dynamic events of the front end (advance :React)

4. ES6 means the Ecma Script.

5.For making the login system ,

      \_\_\_\_ CRUD : for the admin system 6. Requirements : We will make the use of the

      \_\_\_\_ framework : 80% developers use the Bootstrap

      \_\_\_\_ CSS and few will make the use of Tailwind CSS.

7. Bootstrap is the process of copy-paste / intellegence

      \_\_\_\_ to make use while not doing much effort and save the time.
